

Application

Through-conduit gate valves are isolating valves designed for full closing of the working media flow. They can be used for temperatures up to 200°C. If the gate valves are used for regulating or throttling purposes, the manufacturer does not guarantee the tightness. The gate valves are full-bore piggable valves with a flow resistance coefficient equal to that of the piping. Therefore they are suitable especially for long-distance pipeline systems.

Working medium

- water
- non-corrosive liquids
- petroleum and petroleum products
- gas

The working medium shall not contain any mechanical impurities.

Technical description

The gate valves are designed in compliance with API 6D.

- **Cast-welded design** - the gate valve body is made of castings and wrought semi-finished products.
- **Welded design** - the gate valve body is made of wrought semi-finished products.

The body parts and the bonnet are connected by a flanged joint. The slide is entered from the top (TOP ENTRY) and the obturator can be situated in its lower part or its upper part as required by the customer. The design of seats incorporates a primary metal-to-metal sealing and a secondary soft sealing ring in the seat. The design of seats enable to depressurize the valve body cavity (DBB) and to relieve the increased pressure from the body cavity to the piping automatically. The stem is sealed by self-sealing PTFE lip seals or O-rings.

Operation

- manual bevel gear
- electric actuator
- pneumatic actuator
- bare stem ready for connection of an actuator

The standard connecting dimensions for connection of a manual gear operator or an electric actuator are according to ISO 5210.

Accessories

- drain valve or plug
- vent valve or plug
- by-pass valve
- sealant injection to seats and stem
- specific requirements

If accessories are not specified by the customer, the scope of its delivery meets the requirements of API Spec 6D.

Testing

Pressure tests are carried out with water in compliance with API Spec 6D or API 598. Special tests as required by the customer.

Connection to the piping

- **welded ends** - according to ASME B16.25
- **flanged ends** - according to ASME B16.5, ASME B16.47 (by agreement)

End-to-end dimensions according to API Spec 6D.

Installation

The gate valves shall be installed into horizontal piping in vertical position with the actuator on the top only.

Advantages

- very low flow resistance coefficient
- special design of seats - guarantee of 100% tightness
- pigability
- no danger of entrapment of liquid in the body cavity
- seating surfaces of the seats in permanent contact with the gate
- TOP ENTRY design - possibility of refurbishment without removal from the piping system
- stem cover with position indicator
